Prof. Rohini Bhosale

A.Y. 2025-2026 (SEM - I)

Assignment 1 : React Project Setup and Navigation

Aim :

To create a React project using *create-react-app* (or Vite), set up routing using *react-router-dom*, and build a top navigation bar with links to different pages such as **Home, Book, Book, Destination, About, Login, and Profile.**

Theory :

- Introduction to React

React is an open-source JavaScript library developed by Facebook for building fast, interactive user interfaces. It is mainly used to create Single Page Applications (SPAs) where only parts of the page update dynamically, without full reloads.

React follows a component-based architecture, where the user interface is broken down into reusable components. Each component manages its own logic and rendering, making development more modular and maintainable.

React uses a Virtual DOM to optimize rendering. Instead of updating the entire webpage, it compares changes in a virtual copy of the DOM and updates only the affected elements. This makes applications faster and more efficient.

- React Project Setup

React Project Setup

To quickly set up a React environment, we can use either:

create-react-app, or

Vite (a modern, faster alternative)

These tools automatically configure Webpack, Babel, and development servers for us.

Commands:

```
npm create vite@latest my-app  
cd my-app  
npm install  
npm run dev
```

This will generate the folder structure and start the development server.

- **React Router and Single Page Applications (SPA)**

In traditional websites, each link click results in a new page request to the server. React, however, uses Single Page Application (SPA) architecture, where only one HTML page is loaded, and the content changes dynamically using JavaScript.

To handle multiple views or pages within an SPA, React developers use a library called react-router-dom.

React Router enables navigation between different components in the application without refreshing the page. It provides components like

- **React Router and Single Page Applications (SPA)**

In traditional websites, each link click results in a new page request to the server. React, however, uses Single Page Application (SPA) architecture, where only one HTML page is loaded, and the content changes dynamically using JavaScript.

To handle multiple views or pages within an SPA, React developers use a library called react-router-dom.

React Router enables navigation between different components in the application without refreshing the page. It provides components like

1. BrowserRouter: Wraps the whole application and keeps the UI in sync with the URL.
2. Routes and Route: Define which component should render for a specific path.
3. Link and NavLink: Used to navigate between pages without reloading.

- **Navigation Bar (Navbar)**

A Navigation Bar is an essential user interface element that allows users to move between different sections of the application easily.

In a React application, the navigation bar is typically created as a separate reusable component. It includes several navigation links (using the Link component from React Router) that point to different routes defined in the application.

Features of a Good Navigation Bar:

1. It is consistent across all pages.
2. It provides clear and visible links to major sections.
3. It is responsive, meaning it adjusts to different screen sizes.
4. It often includes a brand logo or title on the left and menu options on the right.

- **Components and Routing Structure**

In a React project, each webpage or screen is generally represented as a component. Examples of such

components include Home, Products, Cart, Checkout, and Profile. Each of these components is connected using React Router routes.

When the user clicks a link in the navigation bar, the URL changes and the corresponding component is rendered — all without reloading the page.

This creates a smooth and seamless navigation experience for the user.

- Working of Navigation in React

1. The application is wrapped inside a **Router**.
2. Each page or screen is defined as a **Route**.
3. The **Navbar component** contains clickable links to these routes.
4. When a link is clicked, React Router intercepts the navigation event and updates the view accordingly.
5. The **current component** associated with the selected route is displayed dynamically.

This approach provides faster navigation, better user experience, and efficient content loading.

- Advantages of Using React Router and Navigation

1. Improved User Experience: Page transitions are instant without full reloads.
 2. SEO Friendly: Routes can be defined clearly with specific URLs.
 3. Component-Based Organization: Each route corresponds to a specific component, making maintenance easier.
 4. Scalability: New pages and routes can be added easily as the application grows.
 5. Performance: Navigation happens on the client-side, reducing server load.
-

Code:

npm install

react-router-

dom

bootstrap

Main.jsx

```
import React from "react";
import ReactDOM from "react-dom/client";
import App from "./App";
```

```
import "bootstrap/dist/css/bootstrap.min.css";
import "bootstrap/dist/js/bootstrap.bundle.min.js";

ReactDOM.createRoot(document.getElementById("root")).render(
  <React.StrictMode>
    <App />
  </React.StrictMode>
);
```

App.jsx

```
import { BrowserRouter as Router, Routes,
        Route } from "react-router-dom";
```

```

import Navbar from
  "./components/Navbar";
import Footer from
  "./components/Footer";
import Home from "./pages/Home";
import About from "./pages/About";
import Contact from "./pages/Contact";
import Products from "./pages/Products";
import Login from "./pages/Login";
import Signup from "./pages/Signup";

function App() {
  return (
    <Router>
      <div className="d-flex flex-column min-vh-100">
        <Navbar />
        <main className="flex-grow-1 mt-5">
          <Routes>
            <Route path="/" element={<Home />} />
            <Route path="/about" element={<About />} />
            <Route path="/contact" element={<Contact />} />
            <Route path="/products" element={<Products />} />
            <Route path="/login" element={<Login />} />
            <Route path="/signup" element={<Signup />} />
          </Routes>
        </main>
        <Footer />
      </div>
    </Router>
  );
}

export default App;

```

Navbar.jsx

```

import { BrowserRouter as Router, Routes, Route } from "react-router-dom";
import Navbar from "./components/Navbar";
import Footer from "./components/Footer";
import Home from "./pages/Home";
import About from "./pages/About";
import Contact from "./pages/Contact";
import Products from "./pages/Products";
import Login from "./pages/Login";
import Signup from "./pages/Signup";

```

```
function App() {
  return (
    <Router>
      <div className="d-flex flex-column min-vh-100">
        <Navbar />
        <main className="flex-grow-1 mt-5">
          <Routes>
            <Route path="/" element={<Home />} />
            <Route path="/about" element={<About />} />
            <Route path="/contact" element={<Contact />} />
            <Route path="/products" element={<Products />} />
            <Route path="/login" element={<Login />} />
            <Route path="/signup" element={<Signup />} />
          </Routes>
        </main>
        <Footer />
      </div>
    </Router>
  );
}

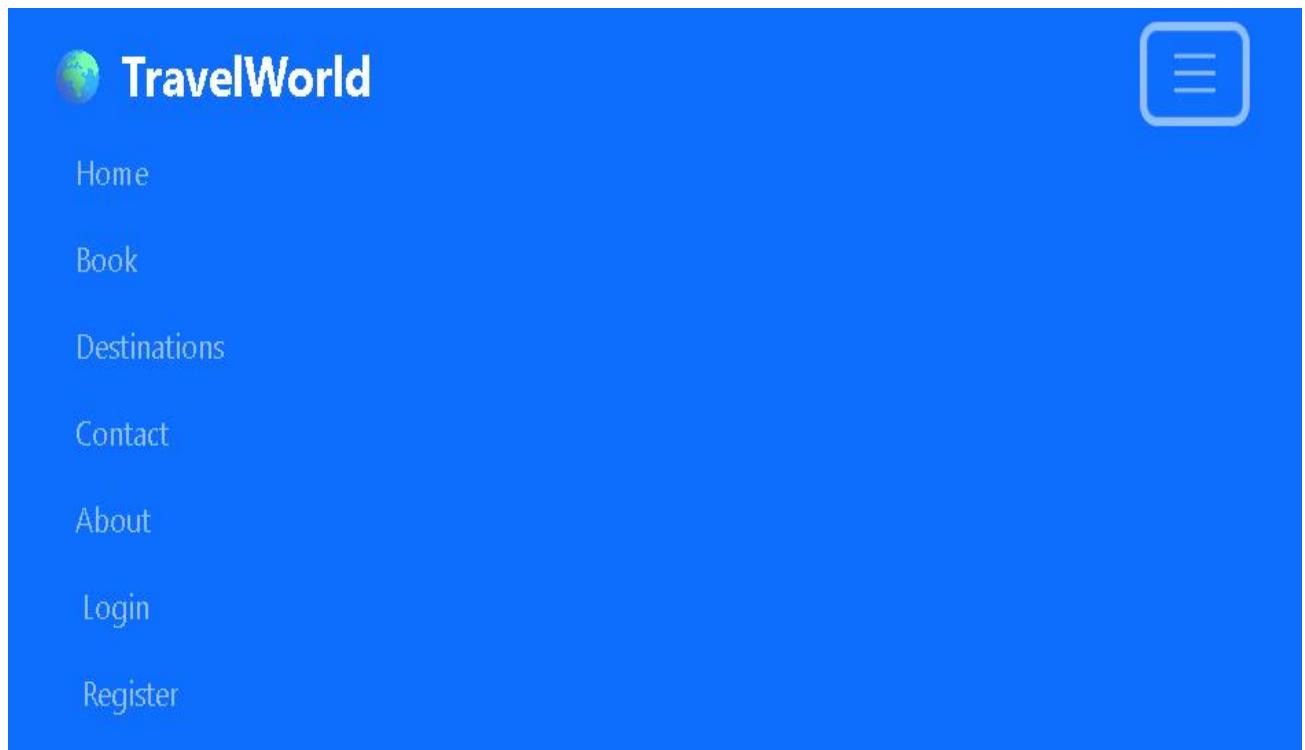

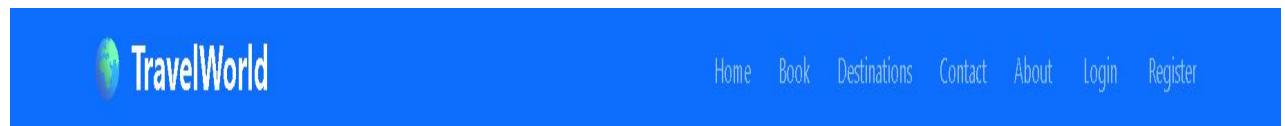

export default App;
```

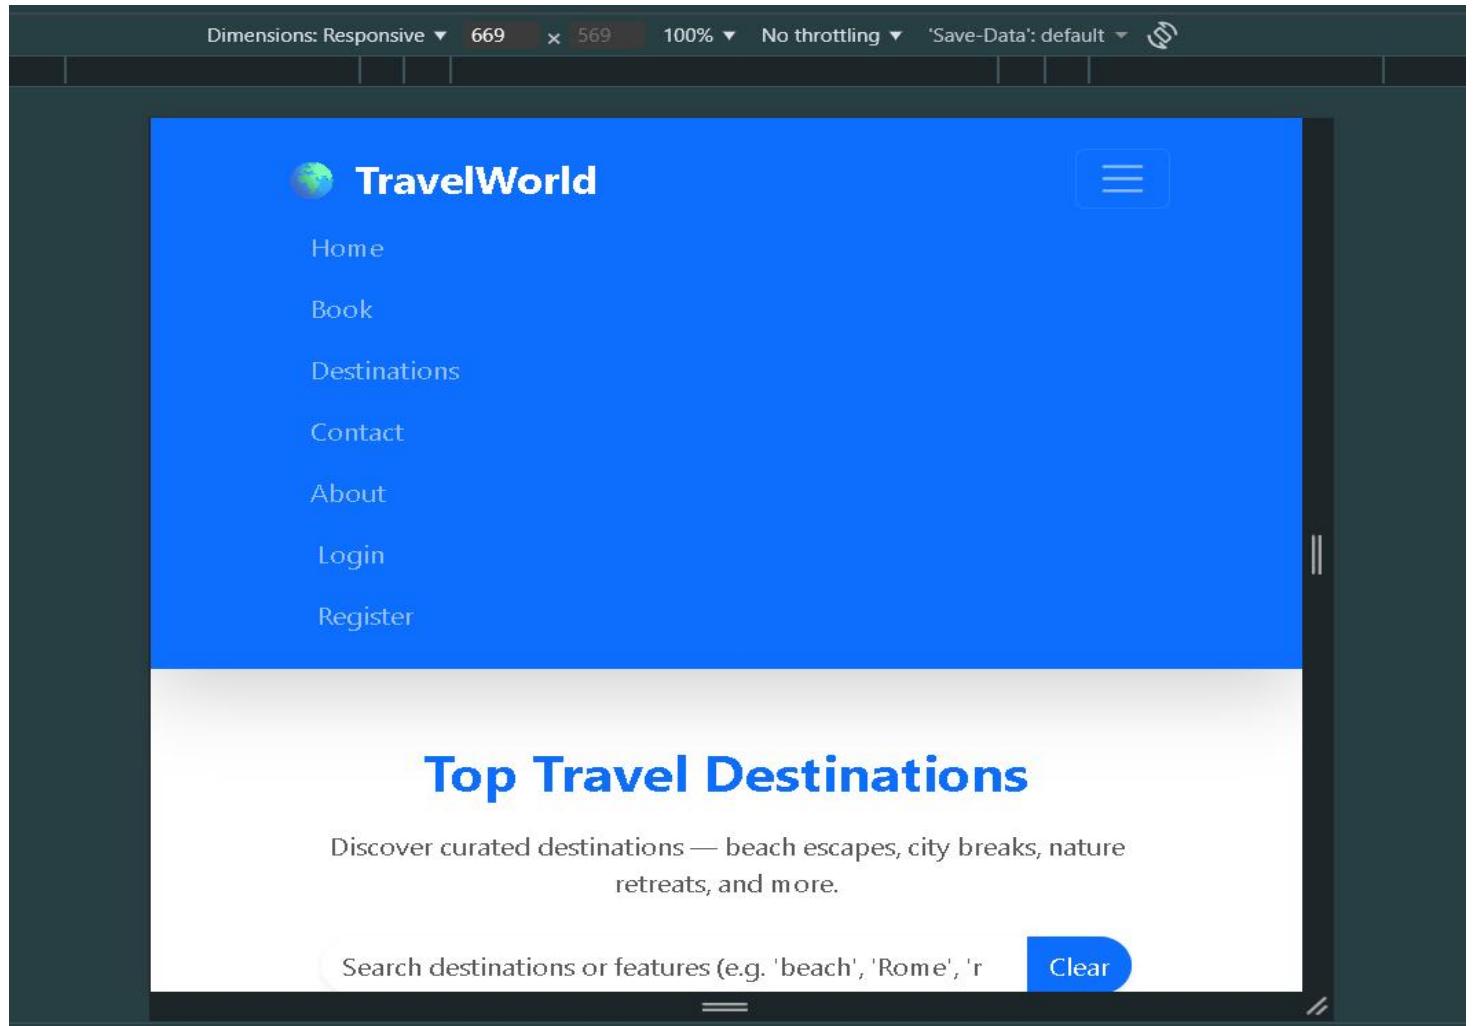

Footer.jsx

```
function Footer() {
  return (
    <footer className="bg-dark text-light text-center py-3 mt-auto">
      <p className="mb-0">© 2025 PharmEasy. All Rights Reserved.</p>
    </footer>
  );
}
```

```
export default Footer;
```

Output:

Conclusion :

We successfully implement Navbar using jsx.

Assignment 2 : Home Page Development

Aim :

To design and develop the Home Page layout of a React application that includes featured products or categories and a functional search bar that filters products by name or category

Theory :

- **Introduction**

The Home Page serves as the main entry point of a web application. It provides users with an overview of the site's purpose, displays key products or categories, and allows smooth navigation to other sections.

In this assignment, the Home Page is built using React functional components, Bootstrap for responsive design, and state management for dynamic search functionality

- **Concept of Components in React**

React applications are built using components — independent, reusable blocks of UI. Each component manages its own logic and rendering.

In this assignment:

Home.js → Acts as the main page component.

ProductCard.js → Acts as a reusable child component to display individual product details like name, category, price, and image.

This modular structure enhances readability, maintainability, and reusability.

- **Designing the Home Page Layout**

A typical Home Page includes:

A header/banner to greet users.

A search bar for quick filtering of products.

A featured products section arranged in a grid layout.

Using Bootstrap's responsive grid classes (container, row, col-md-4), the layout automatically adapts to different devices (mobile, tablet, desktop).

Featured Products or Categories

The featured section displays a list of products dynamically using React's map() function.

Each product object contains:

id

name

category

price

image

These are stored in a local array or fetched from a data file.

The ProductCard component receives product data via props and renders it neatly in a card format.

This makes adding or updating products effortless without touching the layout code.

- **Search Bar Functionality**

-

The search bar enables users to filter products in real-time.

Implementation steps:

Use React's useState() to store the searchTerm.

Use the onChange event on the input field to update the search term dynamically.

Use JavaScript's filter() and includes() methods to display only matching products.

As the user types, the displayed products automatically update — without refreshing the page — creating a smooth user experience.

- **Styling and Responsiveness**

- Bootstrap provides predefined classes for spacing, typography, and layout.
- container → Centers the content.
- row and col-md-* → Divide products into grid columns.
- card → Used for structured product display.

Additional custom CSS ensures proper spacing and color consistency across all screen sizes.

Code :

Home.jsx

```
import React from "react";
import { Link } from "react-router-dom";

export default function Home() {
  const slides = [

                                         <span className="carousel-  
control-next-icon" aria-hidden="true"  
/>>  
  
                                         </button>
```

Output:

The screenshot shows the homepage of TravelWorld. At the top, there is a search bar with the placeholder text "Search destinations, activities...". Below the search bar are three main call-to-action boxes: "Popular Destinations" (Explore our most booked places across the world! View All), "Book Your Trip" (Ready for a new adventure? Start booking now! Book Now), and "Register" (Create a new account to start your journey with us. Register Now). A blue circular icon is located in the top right corner of the header area. The main content area features a section titled "What Our Travelers Say" with a testimonial from Prathmesh W. about their unforgettable vacation. At the bottom of the page is a dark footer section containing the TravelWorld logo, the tagline "Your trusted partner for unforgettable travel experiences.", links to "About", "Contact", and "Privacy", and a copyright notice: "© 2025 TravelWorld. All rights reserved." A small URL "localhost:3001/destinations" is visible at the very bottom left.

Conclusion :

We successfully implemented Home page , Footer and Search Functionality

Assignment 3 : Fetch product data from array or static JSON file

Aim :

To understand and implement Routing in React using the react-router-dom library, and to design a Destinations Page that displays a list of travel destinations with their details and an option to view or book them.

Theory :

- **Introduction to Routing**

Routing in React refers to the method of navigating between multiple views in a Single Page Application (SPA) without reloading the entire page.

Instead of the traditional full-page reloads, React uses client-side routing handled by JavaScript — which makes navigation faster and smoother.

This is achieved using the React Router DOM library.

- **What is React Router ?**

react-router-dom is a popular library for handling navigation and routes in React applications. It allows mapping specific URL paths to corresponding React components.

For example:

/ → Home Page

/destinations → Destinations Page

/contact → Contact Page.

- **Components of React Router**

Component	Description
BrowserRouter	The main container that keeps the UI in sync with the URL. It wraps the entire app.
Routes	Acts as a container for all route definitions.
Route	Defines a specific path and the component that should render when the path is matched.

Link	Replaces <a> tags for navigation. Prevents page reload and provides smooth transitions.
NavLink	Similar to Link, but adds active styling to indicate the current route.
useNavigate	A react hook that allows programmatic navigation

- How Routing Works ?

The whole app is wrapped in <BrowserRouter>.

<Routes> contains different <Route> components.

When the user clicks a link, React Router dynamically loads the required component.

The page content changes, but the browser doesn't refresh — giving an SPA experience.

- Advantages of Routing

- Fast navigation – no full reloads
- Smooth user experience
- Better maintainability – components separated cleanly
- Dynamic routing support (e.g., /destinations/:id)
- Reusable layouts – header/footer remain constant

Code :

```
import { useState } from "react";
import { useNavigate } from "react-router-dom";
import DestinationCard from
"../components/DestinationCard";
```

```
function Home() {
  const [searchTerm, setSearchTerm] =
  useState("");
  const navigate = useNavigate(); // Hook for
  navigation
```

```
const destinations = [
  { id: 1, name: "Paris", country: "France",
  price: 40000, image: "paris.jpg" },
  { id: 2, name: "Tokyo", country: "Japan",
  price: 55000, image: "tokyo.jpg" },
```

```
{ id: 3, name: "Bali", country: "Indonesia",
price: 35000, image: "bali.jpg" },
{ id: 4, name: "Dubai", country: "UAE",
price: 60000, image: "dubai.jpg" },
];
```

```
const filteredDestinations =
destinations.filter(
(d) =>
d.name.toLowerCase().includes(searchTerm.
toLowerCase()) ||
```

```
d.country.toLowerCase().includes(searchTe
rm.toLowerCase())
);
return (
```

```

<div className="container mt-5 pt-5">
  <h2 className="text-center mb-4">Explore Top Destinations</h2>
  {/* Search Bar */}
  <div className="text-center mb-4">
    <input
      type="text"
      className="form-control w-50 mx-auto"
      placeholder="Search by destination or country..."
      value={searchTerm}
      onChange={(e) =>
        setSearchTerm(e.target.value)}
    />
  </div>

  <div className="row justify-content-center">
    {filteredDestinations.length > 0 ? (
      filteredDestinations.map((destination)
      => (

Conclusion :

We successfully implemented routing and data fetching from a static array in the TravelWorld React project.

The home page dynamically renders destinations, supports real-time search filtering, and enables smooth navigation enhancing user interactivity and experience.

Assignment 4 : Destinations Page

Aim :

To design and develop a Destinations Page in React that dynamically displays a list of travel destinations with details such as image, name, location, description, price, and rating, along with a “Book Now” button.

The page also includes a functional search bar to filter destinations by name or description.

Theory :

- **Introduction**

The Destinations Page is one of the main sections of the TravelWorld web application.

It provides users with a catalog of travel destinations where they can browse popular locations, explore details, and proceed toward booking.

In React, this page is implemented as a functional component, combining logic and UI structure .

- **Component-Based Architecture**

React applications are structured using reusable components.

For this page:

Destinations.js acts as the main page component handling state, data, and filtering.

DestinationCard.js acts as a reusable subcomponent responsible for displaying each destination's details.

This modular approach ensures scalability, clean structure, and easy maintenance — changes to how a destination is displayed can be made in just one place.

- **Featured Products or Categories**

The featured products section highlights key products or categories to attract user attention.

In React, this is implemented by maintaining a list (array) of products inside the component's state. Each product has attributes such as:

- id
- Name

- country
- image

These are rendered dynamically using the `.map()` function, allowing automatic display of all destinations without writing repetitive code.

- **Search Bar Functionality**

The search bar allows users to quickly find destinations.

It is implemented using:

`useState()` to store the search term.

`onChange` event to update the search term as the user types.

`filter()` function to dynamically filter the list by matching the user input with destination name or description.

This creates real-time search filtering, improving the interactive experience.

- **Routing and Navigation**

Navigation to the Destinations Page happens through the Navbar using the `<Link>` component from react-router-dom.

When users click on “Destinations” in the navigation bar or select a destination on the Home page, they are directed to `/destinations` without page reload.

This behavior is part of React’s Single Page Application (SPA) nature.

Code:

```
// src/pages/Destinations.jsx
import React, { useEffect, useMemo, useState } from "react";
import AOS from "aos";
import "aos/dist/aos.css";
import "bootstrap/dist/css/bootstrap.min.css";

export default function Destinations() {
  useEffect(() => {
```

```
    AOS.init({ duration: 800, once: true,
    offset: 80 });
  }, []);

const destinations = useMemo(() => [
  { name: "Paris, France", image: "/images/paris.jpg", desc: "Enjoy the city
  of love with iconic landmarks like the Eiffel Tower and the Louvre." },
  { name: "Tokyo, Japan", image: "/images/tokyo.jpg", desc: "Experience vibrant culture, tech-forward districts and" }
```

```

timeless temples." },
{ name: "Dubai, UAE", image:
"/images/dubai.jpg", desc: "Explore luxury
shopping, desert safaris and world-class
architecture." },
{ name: "India", image:
"/images/india.jpg", desc: "A vibrant,
sensory-rich destination full of culture,
food and diverse landscapes." },
{ name: "New York, USA", image:
"/images/cityscape.jpg", desc: "See Times
Square, Central Park and iconic skyline
experiences." },
{ name: "Bali, Indonesia", image:
"/images/beach.jpg", desc: "Tropical
beaches, temples and relaxed island life." },
{ name: "Rome, Italy", image:
"/images/rome.jpg", desc: "Walk through
history visiting the Colosseum and
Vatican." },
{ name: "Cape Town, South Africa",
image: "/images/mountains.jpg", desc:
"Table Mountain, coastal scenery and
wildlife experiences." },
{ name: "London, UK", image:
"/images/london.jpg", desc: "Big Ben, the
London Eye and world-class museums." },
{ name: "Switzerland", image:
"/images/switzerland.jpg", desc: "Alpine
vistas, lakes and charming villages." },
{ name: "Santorini, Greece", image:
"/images/santorini.jpg", desc:
"Whitewashed houses, blue domes and
breathtaking sunsets over the Aegean." },
{ name: "Machu Picchu, Peru", image:
"/images/machu.jpg", desc: "Ancient Incan
citadel set high in the Andes — a bucket-
list archaeological wonder." }
], []);

const [query, setQuery] = useState("");
const results = useMemo(() => {
  const q = query.trim().toLowerCase();
  if (!q) return [];
  return destinations.filter(d =>
    d.name.toLowerCase().includes(q) ||
    d.desc.toLowerCase().includes(q)
  );
}, [query, destinations]);

function handleImgError(e) {
  e.currentTarget.onerror = null;
  e.currentTarget.src =
  "/images/placeholder.jpg";
}

Conclusion :

We successfully designed and implemented the Destinations Page in the TravelWorld React application. The page dynamically displays a list of travel destinations with real-time search filtering and smooth navigation — showcasing React's component-based design and routing capabilities

Assignment 5 : About Page

Aim :

To design and develop an About Page in React that provides an overview of the website's purpose, mission, and services. The page includes descriptive text, images, and responsive layout design using Bootstrap

Theory :

- **Introduction**

The About Page plays an important role in any website by presenting background information about the organization or platform.

In the TravelWorld React project, the About page describes the platform's mission to help users explore destinations, learn about travel experiences, and access services easily.

It is created as a React functional component and styled using Bootstrap classes for responsiveness and layout

- **Concept of React Components**

React applications follow a component-based architecture, where each page is built as a separate component.

The About Page is implemented as:

About.jsx — the page-level component containing text, structure, and styling.

It is rendered through Routing using react-router-dom.

This modular structure helps maintain clear separation between UI and logic, improves readability, and allows easy modification in the future..

- **Page Layout and Design**

The About Page is designed using a combination of Bootstrap grid and utility classes.

The layout includes:

A header or title section.

An image or illustration that represents travel or adventure.

A descriptive paragraph explaining the platform's mission and values.

A clean and visually balanced structure with padding, margins, and responsive design..

Code :

```
import React, { useEffect } from "react";
import AOS from "aos";
import "aos/dist/aos.css";
import "bootstrap/dist/css/bootstrap.min.css";

export default function About() {
  useEffect(() => {
    AOS.init({ duration: 800, once: true });
  }, []);
}

return (
  <div className="bg-light d-flex flex-column min-vh-100">

2"></i>Contact Us
      </button>
    </div>
  </div>
</section>
</main>
</div>
);
}

```

Output :

The screenshot shows the 'About' page of the TravelWorld website. At the top, there's a blue header bar with the TravelWorld logo and a navigation menu including Home, Book, Destinations, Contact, About, Login, and Register. Below the header, a large section title 'About TravelWorld' is centered. A brief mission statement follows: 'We're on a mission to make travel easy, affordable, and inspiring. Whether you're looking for a relaxing beach holiday or an adventurous trek, TravelWorld brings you curated experiences and unmatched convenience.' Underneath, a section titled 'What We Offer' lists three services: Flight Booking, Hotel Reservations, and Guided Tours, each with a small icon and a 'Learn More' button. Below this, there's a row of four small images representing travel: a yellow airplane, a hand pointing at a 'BOOK ONLINE' button, a night cityscape, and a beach scene with a umbrella.

The screenshot shows the 'Why Choose TravelWorld?' page. It features a dark header bar with the TravelWorld logo and a navigation menu. The main content area has a white background with a central blue callout box. The title 'Why Choose TravelWorld?' is at the top. Below it are four circular icons with text: 'Expert Guidance' (Personalized itineraries by travel experts with 24/7 support), '24/7 Customer Support' (Round-the-clock assistance before, during, and after trips), 'Secure Booking' (Encrypted transactions and advanced data protection), and 'Global Reach' (Access to 500+ destinations worldwide with trusted partners). The blue callout box contains the heading 'Ready to Start Your Journey?' followed by the text 'Join thousands of satisfied travelers who trust TravelWorld.' and two buttons: 'Explore Destinations' and 'Contact Us'. At the bottom, there's a dark footer bar with the TravelWorld logo, a copyright notice ('© 2025 TravelWorld. All rights reserved.'), and a Windows taskbar with various pinned icons.

Conclusion :

We successfully developed the About Page of the TravelWorld React application using React components and Bootstrap.

This page effectively communicates the website's purpose, ensuring a visually appealing and responsive design that enhances user engagement.

Assignment 6 : Checkout Page

Aim :

To design and develop a Booking Page in React that allows users to enter trip details such as destination, travel dates, number of travellers, and special requests, with validation and a success modal message after submission.

Theory :

- Introduction

The Booking Page enables users to make or simulate trip reservations by submitting travel information.

It demonstrates form handling, validation, animations, and Bootstrap modal integration in React.

This page is implemented using:

React functional components

useEffect and useRef hooks

Bootstrap 5 for layout, form styling, and modals

AOS (Animate On Scroll) for entry animations

- Concept and Working

Form Design and Validation

Uses Bootstrap's needs-validation classes to show validation feedback.

React's handleSubmit() prevents submission if fields are invalid.

Custom validation ensures the end date is after the start date.

Setting Minimum Dates Dynamically

The useEffect() hook runs once on page load to set today's date as the minimum allowed for both start and end dates.

Modal Handling

The success message uses a Bootstrap Modal triggered by useRef() and new window.bootstrap.Modal() once the form is successfully validated and submitted.

AOS Animation

The booking card smoothly animates on scroll using data-aos="zoom-in".

Responsive Design

Bootstrap grid (col-md-6, container, row) ensures that the booking form looks clean on all screen sizes.

Code:

```
import React, { useEffect, useRef } from
"react";

import AOS from "aos";

import "aos/dist/aos.css";

import
"bootstrap/dist/css/bootstrap.min.css";

import
"bootstrap/dist/js/bootstrap.bundle.min.js
";

export default function Booking() {
  const modalRef = useRef();

  useEffect(() => {
    AOS.init({ duration: 800, once: true,
offset: 80 });

    // Set today's date as minimum for both
date fields

    const today = new
Date().toISOString().split("T")[0];

    document.getElementById("startDate").set
Attribute("min", today);

    document.getElementById("endDate").set
Attribute("min", today);
  }, []);

  const handleSubmit = (e) => {
    e.preventDefault();
    const form = e.target;
```

```
      if (!form.checkValidity()) {
        form.classList.add("was-invalidated");
        return;
      }

      const startVal = form.startDate.value;
      const endVal = form.endDate.value;
      if (new Date(endVal) < new
Date(startVal)) {
        alert("End date must be after start
date!");
        return;
      }

      const modal = new
window.bootstrap.Modal(modalRef.current);
      modal.show();
      form.reset();
      form.classList.remove("was-invalidated");
    };
  }

  return (
    <div className="d-flex flex-column min-
vh-100 bg-light">
      <main className="container py-5 flex-
grow-1">
        <div className="row justify-content-

  onSubmit={handleSubmit}>
  <div className="mb-3">
    <label htmlFor="destination"
      className="form-label">
      Select Destination
    </label>
    <select
      id="destination"
      name="destination"
      className="form-select"
      required>
      <option value="">Choose
      destination</option>
      <option
        value="paris">Paris</option>
      <option
        value="london">London</option>
      <option
        value="tokyo">Tokyo</option>
      <option
        value="dubai">Dubai</option>
    </select>
    <div className="invalid-feedback">
      Please choose a destination.
    </div>
  </div>
<div className="row g-3 mb-3">
  <div className="col-6">
    <label htmlFor="startDate"
      className="form-label">
      Start Date
    </label>
    <input
      id="startDate"
      name="startDate"
      type="date"
      className="form-control"
      required>
    </input>
    <div className="invalid-feedback">
      Start date is required.
    </div>
  </div>
</div>

```

```

<div className="col-6">
  <label htmlFor="endDate"
  className="form-label">
    End Date
  </label>
  <input
    id="endDate"
    name="endDate"
    type="date"
    className="form-control"
    required
  />
  <div className="invalid-feedback">
    End date is required and must
    be after start date.
  </div>
</div>

<div className="mb-3">
  <label htmlFor="travelers"
  className="form-label">
    Number of Travelers
  </label>
  <input
    id="travelers"
    name="travelers"
    type="number"
    min="1"
    max="20"
    className="form-control"
  >
  placeholder="e.g. 2"
  required
/>
<div className="invalid-feedback">
  Enter a number of travelers (1-
  20).
</div>
</div>

<div className="mb-4">
  <label htmlFor="requests"
  className="form-label">
    Special Requests
  </label>
  <textarea
    id="requests"
    name="requests"
    rows="4"
    className="form-control"
    placeholder="Any special
    requirements..."></textarea>
</div>

<div className="d-grid">
  <button type="submit"
  className="btn btn-primary btn-lg">
    <i className="fas fa-check me-
    2"></i>Submit Booking
  </button>
</div>

```

```
</form>
</div>
</div>
</div>
</div>
</main>

/* Success Modal */

<div className="modal fade"
ref={modalRef} tabIndex="-1">
<div className="modal-dialog modal-
dialog-centered">
<div className="modal-content">
<div className="modal-header">
<h5 className="modal-
title">Booking Submitted</h5>
<button
type="button"
className="btn-close"
data-bs-dismiss="modal"
></button>
</div>
<div className="modal-body">

Your booking request was
submitted successfully (demo). You'll
receive confirmation soon.

</div>
<div className="modal-footer">
<a href="/profile" className="btn
btn-outline-primary">
Go to Profile
</a>
```

```

        );
    }
}

</div>
        export default Checkout;
</div>

```

Output:

The screenshot shows a web application interface for 'TravelWorld'. At the top, there's a blue header bar with the 'TravelWorld' logo on the left and navigation links for Home, Book, Destinations, Contact, About, Login, and Register on the right. Below the header is a main content area with a white background. In the center, there's a form titled 'Book Your Trip' with the sub-instruction 'Tell us basic details and we'll prepare a booking (demo)'. The form fields include a dropdown for 'Select Destination' labeled 'Choose destination', two date inputs for 'Start Date' and 'End Date' (both set to 'dd-mm-yyyy'), a text input for 'Number of Travelers' (with placeholder 'e.g. 2'), and a text area for 'Special Requests' with placeholder 'Any special requirements...'. A large blue button at the bottom of the form is labeled 'Submit Booking'.

Conclusion :

We successfully implemented the Booking Page using React functional components, Bootstrap, and AOS animations.

The form validates inputs, checks date logic, and shows a dynamic success modal, demonstrating interactive UI design and real-time validation within a single page..

Assignment 7 : Profile Page

Aim :

To design and develop a Profile Page using React that displays user information, allows profile updates, and integrates smooth animations for a better user experience.

Theory :

- **Introduction**

The Profile Page is a crucial part of any web application that provides a personalized experience for users. It contains details such as name, email, and preferences and may allow users to view or edit their information.

In this assignment, the Profile Page is created using React functional components, Bootstrap for layout and styling, and AOS (Animate On Scroll) for animations.

- **Purpose of the Profile Page**

- The purpose of the Profile Page is to provide a personalized space for users within a web application. It allows users to view, manage, and update their personal information such as name, email, and bio.
- It enhances the user experience by giving users control over their data and a sense of ownership within the platform. In addition, the profile page serves as a central hub for user-specific actions, preferences, and saved data.
- In the context of the TravelWorld React project, the Profile Page:
- Displays the user's basic details and travel preferences.
- Allows the user to update or modify their information easily.
- Provides a consistent and interactive interface using React state management.
- Improves usability by making the website more personalized and dynamic.

- **Concept of State and Props in React:**

1. React components use state to manage and update dynamic data on the page without reloading it.
2. The useState() hook is used for managing form input values (like name and email).
3. Props can be used if user data is passed from a parent component, though here we're managing it locally.
4. This ensures reactivity — the UI automatically updates when the data changes.

- Design and Structure

Design and Structure:

The Profile Page is designed using Bootstrap grid and card components for a clean and responsive interface.

It includes:

User avatar and name displayed at the top.

Editable form fields (Name, Email, and Bio).

Buttons for updating the profile.

AOS animation for fade-in effects.

The layout is fully responsive and maintains proper spacing and alignment.

Code :

```
import React, { useRef } from "react";

export default function Profile() {
  const formRef = useRef(null);

  function handleSubmit(e) {
    e.preventDefault();
    const form = formRef.current;
    const fullname = form.fullname.value.trim();
    const email = form.email.value.trim();
    const newpass = form.newpass.value;
    const confirmpass = form.confirmpass.value;

    let valid = true;

    // Validation
    if (!fullname) {
      form.fullname.classList.add("is-invalid");
      valid = false;
    } else {
      form.fullname.classList.remove("is-invalid");
    }

    if (!email || !/.+@.+\.+/test(email)) {
      form.email.classList.add("is-invalid");
    }
    valid = true;

    if (newpass || confirmpass) {
      if (newpass !== confirmpass || newpass.length < 8) {
        form.confirmpass.classList.add("is-invalid");
        valid = false;
      } else {
        form.confirmpass.classList.remove("is-invalid");
      }
    } else {
      form.confirmpass.classList.remove("is-invalid");
    }

    if (valid) {
      const modalEl =
        document.getElementById("successModal");
      const bsModal = new
        window.bootstrap.Modal(modalEl);
      bsModal.show();
    }
  }
}
```

```
return (
  <>
  <div className="container py-5 d-flex justify-
content-center align-items-center"
style={{ minHeight: "80vh" }}>
  <div className="col-12 col-md-8 col-lg-5">

  </div>
</div>
</div>

{/* ✅ Success Modal */}
<div
  className="modal fade"
  id="successModal"
  tabIndex="-1"
  aria-labelledby="successModalLabel"
  aria-hidden="true"
>
  <div className="modal-dialog modal-dialog-centered">
    <div className="modal-content">
      <div className="modal-header">
        <h5 className="modal-title"
id="successModalLabel">
          Profile Updated
        </h5>
        <button
          type="button"
          className="btn-close"
          data-bs-dismiss="modal"
          aria-label="Close"
        />
      </div>
      <div className="modal-body">
        Your profile has been updated
        successfully (demo only).
      </div>
      <div className="modal-footer">
        <button
          type="button"
          className="btn btn-secondary"
          data-bs-dismiss="modal"
        >
          Close
        </button>
      </div>
    </div>
  </div>
);
```

Output :

Conclusion:

We successfully implemented Profile Page.

Assignment 8 : Contact Page

Aim :

To design and implement a Contact Page that allows users to send feedback or inquiries through a structured form integrated into the TravelWorld website.

Theory :

The Contact Page acts as an interactive bridge between users and the website administrators. It provides users a simple and organized way to share their messages, questions, or concerns.

In React, forms are handled using controlled components, meaning each input field's value is tied to React state. This ensures data consistency and allows easy validation before submission.

Core concepts used:

React useState Hook: For managing form field values (name, email, message).

Form Validation: Ensures that the fields are not empty before submission.

Event Handling: Captures and manages user inputs using onChange and onSubmit events.

Responsive Design: Styled using Bootstrap to maintain consistent UI across devices.

The Contact Page also strengthens user trust and enhances engagement by showing the brand's responsiveness and transparency

Code :

```
import React, { useEffect } from "react";
import "bootstrap/dist/css/bootstrap.min.css";
import "aos/dist/aos.css";
import AOS from "aos";

function Contact() {
  useEffect(() => {
    AOS.init({ duration: 900, once: true, offset: 80 });
  }, []);

  const handleSubmit = (e) => {
    e.preventDefault();
    e.target.classList.add("was-validated");
    if (!e.target.checkValidity()) return;
    alert("Thanks — your message was sent (demo). We'll get back to you soon.");
    e.target.reset();
    e.target.classList.remove("was-validated");
  };

  return (
    <div className="bg-light min-vh-100 d-flex flex-column">
      <main className="container py-5 flex-grow-1">
        <div className="row justify-content-center mb-4">
          <div className="col-lg-8 text-center">
            <h1
              className="h3 fw-bold text-primary mb-2 display-contact"
              data-aos="fade-down"
            >
              Get in Touch
            </h1>
            <p className="text-muted mb-0">
              Have questions or need help planning
              your next trip? Send us a
              message — we're here to help.
            </p>
          </div>
        </div>

        <div className="row g-4">
          <div className="col-lg-6" data-aos="fade-right">
            <div className="bg-white p-4 rounded shadow-sm">
              <form
                className="needs-validation"
                noValidate
              >
```

```
onSubmit={handleSubmit}
>
<div className="mb-3">
  <label className="form-label">Full Name</label>
  <input
    type="text"

    >
      <i
        className="fas fa-paper-plane me-2"
      ></i>Send Message
    </button>
  </div>
</form>
</div>
</div>
```

```

<div className="col-lg-6" data-aos="fade-left">
  <div className="bg-white p-4 rounded shadow-sm h-100 d-flex flex-column justify-content-between">
    <div>
      <h2 className="h5 text-primary fw-bold">Contact Information</h2>
      <p className="text-muted mb-4">
        Reach us via phone, email, or drop by our office.
      </p>

      <div className="mb-3">
        <h6 className="fw-semibold mb-1">Address</h6>
        <p>123 Pune, Loni Kalbhor, 412201</p>
      </div>

      <div className="mb-3">
        <h6 className="fw-semibold mb-1">Phone</h6>
        <p>
          <a href="tel:+1234567890" className="text-decoration-none text-dark">
            >
            +1 234 567 890
          </a>
        </p>
      </div>

      <div className="mb-3">
        <h6 className="fw-semibold mb-1">Email</h6>
        <p>
          <a href="mailto:support@travelworld.com" className="text-decoration-none text-dark">
            >
            support@travelworld.com
          </a>
        </p>
      </div>

      <div>
        <h6 className="fw-semibold mb-1">Follow Us</h6>
      </div>
    </div>
  </div>

```

```

<div className="d-flex gap-3 align-items-center">
  <a href="https://facebook.com" target="_blank" rel="noopener noreferrer" className="text-primary">
    <i className="fab fa-facebook-f fa-lg"></i>
  </a>
  <a href="https://twitter.com" target="_blank" rel="noopener noreferrer" className="text-info">
    <i className="fab fa-twitter fa-lg"></i>
  </a>
  <a href="https://instagram.com" target="_blank" rel="noopener noreferrer" className="text-danger">
    <i className="fab fa-instagram fa-lg"></i>
  </a>
</div>
</div>
</div>

<p className="small mb-0 text-muted mt-3">
  Our support team is available 24/7 — we typically respond within 24 hours.
</p>
</div>
</div>
</div>

<div className="row mt-5" data-aos="zoom-in">
  <div className="col-12">
    <div className="shadow-sm rounded overflow-hidden">
      <iframe title="TravelWorld location" src="https://maps.google.com/maps?q=new%20york&t=&z=13&ie=UTF8&iwloc=&output=embed" className="w-100 border-0" style={{ height: "420px", borderRadius: "0.5rem" }} loading="lazy"></iframe>
    </div>
  </div>
</div>
</main>
</div>

```

);
}

export default Contact;

Output :

The screenshot shows the TravelWorld Contact page. At the top, there's a navigation bar with links for Home, Book, Destinations, Contact, About, Login, and Register. Below the navigation is a section titled "Get in Touch" with a sub-instruction "Have questions or need help planning your next trip? Send us a message — we're here to help." On the left, there's a form with fields for "Full Name" (containing "OM Dev"), "Email Address" (containing "xyz@example.com"), and "Message" (containing "Your message..."). A large blue button labeled "Send Message" is at the bottom of the form. On the right, there's a "Contact Information" section with details: Address (123 Pune, Loni Kalbhor, 412201), Phone (+1 234 567 890), Email (support@travelworld.com), and social media links for Follow Us. A note at the bottom states, "Our support team is available 24/7 — we typically respond within 24 hours."

The screenshot shows the TravelWorld Contact page with a map of New York City as the background. The map highlights various neighborhoods like Manhattan, Brooklyn, and Queens, along with landmarks such as the Statue of Liberty, Ellis Island, and the Empire State Building. A callout box in the top-left corner of the map area provides directions to New York, USA, with options to "View larger map" and "Directions". A red text overlay on the map says "Use ctrl + scroll to zoom the map". At the bottom of the page, there's a footer with the TravelWorld logo, the tagline "Your trusted partner for unforgettable travel experiences.", and links for About, Contact, and Privacy. The footer also includes a standard Windows taskbar with icons for File Explorer, Edge, and other applications.

Conclusion:

The Contact Page was successfully implemented using React and Bootstrap.

It demonstrates the use of state management, form handling, and conditional rendering in React.

Assignment 9 : Routing and Component Structure

Aim :

The aim of this assignment is to implement smooth navigation and a modular component structure in the Travel World React project using React Router DOM.

This ensures that users can easily move between pages like Home, About, Destinations, Contact, and Profile without page reloads, while keeping the code organized, reusable, and easy to maintain.

Theory :

1. Introduction

Routing and component structuring are two core pillars of any modern React-based project.

In a traditional multi-page website, each navigation click loads a new HTML document from the server, which is slow and interrupts the user experience.

React introduces a Single Page Application (SPA) approach, where content dynamically updates within one main HTML file using virtual DOM manipulation.

This gives instant transitions, faster performance, and a native-app-like user feel.

The Travel World project uses this principle to allow travelers to explore destinations, read about the company, and contact the team all through seamless internal routing powered by React Router DOM.

2. Concept of Routing in React

Routing in React means controlling which UI component appears based on the current URL path.

The React Router DOM library manages this by mapping URLs to components without requiring full page reloads.

Key Components of React Router DOM:

BrowserRouter: Wraps the entire app and enables routing capabilities.

Routes: Acts as a container for all the routes.

Route: Defines a path and tells which component should be displayed for that path.

Link / NavLink: Enables navigation between routes without refreshing the browser.

useNavigate() & useLocation(): Hooks that help in programmatic navigation and accessing route data.

When the user clicks a link like /about, React Router updates the URL in the address bar but renders the About component dynamically instead of reloading the page.

This mechanism gives the illusion of a multi-page website while maintaining SPA performance.

3. Routing in Travel World

In the Travel World project:

The Navbar contains navigation links.

Each link is a React Router `<Link>` element.

`App.jsx` defines the routes and ensures each page component loads inside the same layout.

`BrowserRouter` wraps the entire app to make routing accessible globally.

Footer remains constant across all pages for design consistency.

This structure gives users an uninterrupted browsing experience switching pages feels instantaneous.

4. Component-Based Architecture

React promotes component-based development, where each UI part is treated as an independent block of code.

Each component has its own structure, style, and logic, which can be reused across pages.

In Travel World, the interface is divided into:

Navbar → Handles page navigation.

Home → Highlights popular travel destinations.

About → Explains project purpose and travel services.

Contact → Provides inquiry form for users.

Profile → Displays user details or preferences.

Footer → Stays fixed at the bottom for contact/social links.

This modular approach ensures:

Easier debugging and maintenance.

Reusable UI elements.

Better separation of concerns (each component does one task).

5. Data Flow and Reusability

Each component can communicate via props (for passing data) and state (for handling internal logic).

For example, destination cards or navigation links can be stored in arrays and rendered using the `map()` function reducing code duplication.

Reusability ensures that if a component like Navbar or Footer is modified once, the change reflects across all pages automatically.

6. Advantages of Routing and Modular Components

Fast Navigation: No reloading — smoother experience.

Consistency: Shared layout components across all routes.

Maintainability: Each component is independent and easy to update.

Scalability: Adding new pages only requires creating a new component and defining a new Route.

Performance: Only the necessary components re-render when routes change.

7. Security and Protected Routes

In future enhancements, Travel World can implement protected routes for user-only sections like Profile or Bookings.

This ensures that only logged-in users can access specific pages, adding a layer of security and personalization.

Code :

App.jsx

```
import React, { useEffect } from "react";
import { BrowserRouter as Router, Routes, Route } from "react-router-dom";
import AOS from "aos";

import Home from "./pages/Home";
import Booking from "./pages/Booking";
import Destinations from "./pages/Destinations";
import Contact from "./pages/Contact";
import About from "./pages/About";
import Login from "./pages/Login";
import Register from "./pages/Register";

import Navbar from "./Components/Navbar";

```

Output :

Conclusion :

We successfully implemented Components.

Assignment 10 : Full React Application

Aim :

To implement efficient navigation and modular code design in a React-based travel website using React Router for page transitions and reusable components for interface design. The primary goal is to create a single-page application structure where multiple views such as Home, About, Contact, and Profile can be accessed seamlessly without reloading the entire page. Furthermore, the objective includes structuring the user interface into reusable and self-contained components, thereby improving readability, maintainability, and scalability.

Theory :

- All About React

Setting up a React project involves using Create React App, a command-line tool that provides a ready-to-use environment for React development. This setup automatically includes important tools like Webpack, Babel, and ESLint, saving developers from manual configuration. The folder structure typically includes directories for components, pages, and assets, promoting modular design and easy scalability.

Once the project is initialized, React Router DOM is introduced to handle navigation. Traditional web pages refresh entirely when moving between routes, but React applications use client-side routing, which dynamically replaces the visible portion of the DOM without a full reload. The BrowserRouter component acts as the foundation of routing, while Route and Routes determine which component to render based on the current path. This approach creates a seamless user experience.

The Navbar is implemented as a reusable component using React Bootstrap or standard HTML/CSS, containing navigation links. Each link is created using the Link component instead of traditional anchor tags to prevent reloading. The Navbar stays consistent across all pages, while the content below it dynamically changes based on the route. This architecture mimics the structure of real-world web applications where only part of the UI updates, providing both performance and design advantages.

Our project TravelWorld is a responsive travel booking website built using React JS and Bootstrap, designed to give users a modern and interactive travel experience. The platform allows users to explore travel destinations, check booking options, and contact the service team — all within a single-page interface.

To achieve this functionality, we implemented React Router DOM, which allows for smooth navigation between multiple sections without a full page reload. Instead of traditional HTML navigation, where each click reloads the entire page, React Router dynamically renders different components based on the current URL path, ensuring faster performance and better user experience.

The BrowserRouter component wraps the entire app, acting as the main controller for route handling. Inside it, we used the Routes and Route components to define all pages, such as /about, /booking, /contact, and /profile.

Each route corresponds to a React component that represents a page. This setup allows the user to move from one section to another instantly while maintaining the state of the application.

The Navbar component was made reusable and placed at the top of all pages. It includes links for navigation using the Link element from React Router, replacing the traditional <a> tag. This ensures client-side navigation without reloading the browser window. The Navbar also uses conditional rendering — if the user is logged in, it displays the Profile and Logout options; otherwise, it shows Login and Signup.

Similarly, the Footer component appears on every page and contains general copyright and contact information.

Each part of the user interface, including content cards and forms, is created as a separate React component to follow the modular and reusable design pattern. This makes the app scalable and easier to maintain.

By dividing our project into smaller components, we maintained clear separation of logic and design. For example:

The Navbar handles navigation and authentication visibility.

The ProductCard (or DestinationCard) handles display of travel destinations.

The Footer ensures consistent layout across all routes.

This modularity follows the principle of Separation of Concerns, allowing different developers to work independently on different sections without conflict.

As a result, TravelWorld achieves a professional-grade, user-friendly structure that is both easy to extend and maintain.

Code :

```
import React, { useEffect, useRef } from "react";
import AOS from "aos";
import "aos/dist/aos.css";
import "bootstrap/dist/css/bootstrap.min.css";
import
"bootstrap/dist/js/bootstrap.bundle.min.js";

export default function Booking() {
  const modalRef = useRef();

  useEffect(() => {
    AOS.init({ duration: 800, once: true, offset:
80 });

    // set min date
    const today = new
Date().toISOString().split("T")[0];
```

```
document.getElementById("startDate").setAttribute("min", today);

document.getElementById("endDate").setAttribute("min", today);
}, []);

const handleSubmit = (e) => {
  e.preventDefault();
  const form = e.target;
  if (!form.checkValidity()) {
    form.classList.add("was-invalidated");
    return;
  }

  const startVal = form.startDate.value;
  const endVal = form.endDate.value;
```

```

if (new Date(endVal) < new Date(startVal)) {
  alert("End date must be after start date!");
  return;
}

const modal = new
window.bootstrap.Modal(modalRef.current);
modal.show();
form.reset();
form.classList.remove("was-validated");
};

return (
